

IN THE SPECIFICATION:

Please amend paragraph [0028] as follows:

[0028] Figures 3-5 illustrate some of these elements in greater detail. As shown in Fig. 4 and Fig. 5, a vacuum pick up head 12 may be used in association with clamps 13, to remove a napkin 22 from the top of a stack of napkins 23. Other means may be used for removing a napkin from the stack. The stack of napkins is raised until the top napkin contacts the vacuum pick up head 12. The table 14 has cutout portions that allow the stack of napkins 23 to be raised therebetween when the table 14 is appropriately positioned. Conversely, the vacuum head could be lowered to make contact with the top napkin ~~45~~ 22 as well. The stack of napkins is then lowered, leaving the top napkin 22 slightly raised above the stack or the vacuum head may be raised. Clamps 13 that are open, close as soon as the platform 10 is lowered slightly and clamp onto the raised napkin 22 to hold it there, waiting for the rotating table 14 to rotate underneath the napkin ~~45~~ 22. The motor 17 is engaged to cause table 14 to rotate until a pocket 18, as shown in Fig. 6, is underneath the napkin ~~45~~ 22. Then the clamps 13 release the napkin onto the table 14. Figure 4 illustrates area around the vacuum pick up head 12 and the clamps 13 in greater detail.
